Supplementary Fig. S1  Gender had no effect on thrombus weight in rats of inferior vena cava (IVC) stenosis-induced deep vein thrombosis (DVT). At different time points after thrombus induction, IVCs were harvested and weighed. One representative IVC in each group and thrombus weight are shown. Data were expressed as mean ± standard error of the mean (SEM), n = 8.
Supplementary Fig. S2 Surgical operation had no effect on morphological changes and thrombus weight of inferior vena cava (IVCs). Representative haematoxylin and eosin (H&E) staining of IVCs and thrombus weight in normal and sham rats are shown. Data were expressed as mean ± standard error of the mean (SEM), n = 8. Scale bar = 50 μm.
