Supplementary Fig. S1. Subjectively normal appearance of anterior curvature of the pons (arrow) on the midline sagittal T1-weighted image in patient 2. Measurement of the anteroposterior diameter of the pons (12.7 mm) shows a minimal reduction in size when compared to age-matched controls from our institutional database (mean values of 13.34 mm, range 12.95–13.78, measured in twenty preterm newborns born at 25 weeks and scanned at term for equivalent age, without definite brain damage).

Supplementary Fig. S2. Main afferent and efferent connections between cerebellum and cerebral cortex.
