Fig. 1S: Flow cytometric profile of mouse bone marrow cells stained with annexin V and propidium iodide (PI). The treatment groups are as follows: (a) Control, (b) CYN, (c) PCB, (d) CPH, (e) PCB + CYN, (f) CPH + CYN. LL (lower left): live cells (annexin V – FITC negative/PI negative); LR (lower right): early apoptotic cells (annexin V – FITC positive/PI negative); UL (upper left): damaged cells (annexin V – FITC negative/PI positive); UR (up right): necrotic cells and late apoptotic cells (annexin V – FITC positive/PI positive). EGCG (25mg/kg) was used as positive control.
