Fig. 1S Representative HPLC chromatograms of four major active diterpenoids of *A. paniculata*. (A) 50.0 ng/mL of the standards in blank human plasma: andrographolide (1), 14-deoxy-11, 12-didehydroandrographolide (2), neoandrographolide (3), and 14-deoxyandrographolide (4), and cortisone (internal standard, IS). (B) The plasma sample before dosing. (C) The plasma sample 1 h after dosing (obtained from volunteer no. 06). The simultaneous determination of two major active diterpenoids of *A. paniculata*, including compounds 1 and 2 in human plasma, was employed using a validated LC-MS/MS technique.
Fig. 2S Representative electrocardiograms of the subject (subject number 04: female, 38 years old) (A) before and (B) after 3 consecutive days of A. paniculata treatment.
Fig. 3S Representative HPLC chromatograms of four major active diterpenoids of *A. paniculata*. (A) 250 µg/mL of the standards: andrographolide (1), 14-deoxy-11, 12-didehydroandrographolide (2), neoandrographolide (3), and 14-deoxyandrographolide (4), and (B) the *A. paniculata* crude capsules. The four major active diterpenoids were analyzed simultaneously by an HPLC-DAD technique.
