Fig. 1S Effects of extracts on viability of human oral keratinocytes. Ten thousand human oral keratinocytes (Sciencell) were seeded on 96 wells precoated with poly-L-lysine (Sciencell) and cultured in oral keratinocyte medium (Sciencell) for 24 h. The cells were then treated with crude extracts for another 48 h. Cell viability was measured by WST assays using the EZ-CYTOX Cell Viability, Proliferation & Cytotoxicity Assay Kit (Daeillab). The concentration of each extract is at least 2-fold higher than the MIC. Results shown are the mean and standard deviation (error bars) of four independent experiments.
