3. HRMS of 3aa.............................................................................S50
**General Information**

All compounds were fully characterised by spectroscopic data. The NMR spectra were recorded on a Bruker DRX400. Chemical shifts (\(\delta\)) are expressed in ppm. \(J\) values are given in Hz, and deuterated CDCl\(_3\) was used as solvent. The reactions were monitored by thin layer chromatography (TLC) using silica gel GF254. The melting points were determined on a XT-4A melting point apparatus and are uncorrected. HRMs were performed on an Agilent LC/Msd TOF instrument.
