

## Vertex epidural hematoma with pseudoencephalocele

Harjinder S Bhatoe M Ch

Department of Neurosurgery, Command Hospital (SC) and Armed Forces Medical College, Pune 411040

A 22-year-old male reported to the outpatient department with persistent scalp swelling over the right frontoparietal region and dull generalized headache. He had sustained closed head injury due to fall from a two-wheeler two weeks earlier. Clinical evaluation revealed fully conscious patient with no neurological deficit. There were no signs of raised intracranial pressure. He had soft scalp swelling with fluid consistency over the right frontoparietal region. There was no external swelling. CT Brain (Figs. 1a, 1b, 1c) showed a vertex epidural hematoma
