A 50-year-old man who had experienced acute alcoholic pancreatitis 2 years earlier presented with abdominal pain. An abdominal computed tomography (CT) scan revealed a pseudocyst, 16 × 8 cm in size, in the pancreatic tail (Fig. 1). After multidisciplinary discussion, the patient was referred for endoscopic pseudocyst drainage.

Transgastric puncture of the pseudocyst was performed using a 19-gauge fine-needle aspiration needle, under endoscopic ultrasound (EUS) guidance. A 0.035-inch guidewire was advanced through the needle and the tract was dilated to 6 mm. A fully covered double-flanged metal stent (40 × 14 mm) was then deployed across the tract under endoscopic, EUS, and fluoroscopic guidance. The deployment was complicated by complete intracystic migration of the stent. We decided to place a fully covered biliary metal stent (60 × 10 mm) in an attempt to save the performed cystogastrostomy, and planned to retrieve the migrated stent at a later time. The patient was discharged with no symptoms.

The patient was readmitted to our department 1 week later with fever and upper abdominal pain. Abdominal CT scan showed complete migration of the two stents into the pseudocyst cavity (12 × 6 cm) (Fig. 2). Under endoscopic, EUS, and fluoroscopic guidance, we placed another fully covered double-flanged metal stent (40 × 14 mm) through the patent cystogastrostomy (Fig. 3). The two intracystic migrated stents were then removed through the third stent using a foreign body forceps. Effective drainage of the pseudocyst was observed and the patient became asymptomatic (Video 1).

At follow-up 1 month later, after an abdominal CT scan showed complete resolution of the pseudocyst (Fig. 4), the stent was removed endoscopically (Fig. 5).

Intracystic stent migration is a rare (< 1%) complication of endoscopic drainage. It seems to be more frequent in transgastric drainage of pseudocysts of the pancreatic tail owing to variable luminal compression during the creation of cystogastrostomy [1]. We propose an alternative endoscopic method to solve intracystic stent migration, avoiding surgery [2].
