Endoscopic retrieval of a migrated pancreatic stent using a handmade catheter with a guidewire loop

Endoscopic pancreatic stenting (EPS) is performed to relieve obstruction to pancreatic juice flow in patients with various pancreatic conditions [1]. Migration of plastic pancreatic stents is one complication of EPS and occurs at a rate of 5%–6% [2]. The migrated stent should be removed because it may induce a severe pancreatic condition [3]. However, endoscopic removal is technically difficult owing to the small diameter, bending course, and strictures of the pancreatic duct [3,4]. We describe an innovative technique for removing a migrated pancreatic stent.

A 16-year-old male patient who underwent pancreatectoduodenectomy for treatment of traumatic pancreatic injury presented with mild pancreatitis due to pancreaticojejunal anastomotic stenosis. EPS was successfully performed under double-balloon endoscopic retrograde cholangiopancreatography. Four months later, computed tomography revealed proximal migration of the pancreatic stent (Fig. 1). Conventional approaches for retrieval using a basket catheter and snare failed.

A handmade catheter with a guidewire loop was created using a double-lumen catheter (uneven double-lumen catheter; Piolax, Kanagawa, Japan) and a 0.025 inch guidewire (Radifocus; Terumo, Tokyo, Japan) (Fig. 2) as follows. First, the catheter was cut to

Fig. 1 Computed tomography showing a pancreatic stent that has migrated into the pancreatic duct.

Fig. 2 Double-lumen catheter (uneven double-lumen catheter; Piolax, Kanagawa, Japan) and 0.025 inch guidewire (Radifocus guidewire; Terumo, Tokyo, Japan).

a 25 cm length from the edge of the tail side to facilitate guidewire maneuver. Next, both tips of the guidewire were inserted into the open ends of the double-lumen catheter (Fig. 3). The following procedure (Fig. 4) was then performed after obtaining written informed consent. The catheter with the guidewire loop was cannulated over the distal aspect of the stent. The size of the loop was adjusted by simultaneously pushing both guidewires, and the proximal flap of the stent was captured by minimizing the size of the guidewire loop (Fig. 5). Finally, the migrated pancreatic stent was successfully retrieved without grasp slippage or complications (Video 1). This novel procedure can be a simple, safe, and effective option for removing a migrated pancreatic stent.
