Endoscopic transpapillary gallbladder drainage using the balloon occlusion method to advance the guidewire into the cystic duct

Endoscopic transpapillary gallbladder drainage (ETGBD) is effective for patients in whom cholecystectomy or percutaneous transhepatic gallbladder drainage (PTGBD) is contraindicated [1, 2]. However, in some patients, the guidewire cannot be advanced into the cystic duct because of the caudal distribution of the cystic duct. Herein, we present a case in which use of the balloon occlusion method enabled guidewire insertion into a cystic duct with caudal distribution, thus allowing ETGBD to be successfully performed.

An 82-year-old woman with right upper quadrant pain and high fever was admitted to our hospital and diagnosed with acute cholecystitis and Chilaiditi syndrome based on CT findings (Fig. 1). In view of the high surgical risk and contraindication of PTGBD because of the Chilaiditi syndrome, the patient underwent ETGBD. After bile duct cannulation, the cystic duct could not be visualized by cholangiography via the cannula, and guidewire insertion into the cystic duct was impossible. Hence, we inflated an occlusion balloon below the bifurcation of the hilar bile duct and injected a contrast agent via the proximal port of the balloon catheter; this allowed detection of the cystic duct (Fig. 2). However, the guidewire could not be advanced into the cystic duct because of the caudal distribution of the duct. Therefore, we inflated the occlusion balloon right above the origin of the cystic duct take-off. Using a two-devices-in-one-channel method [3], we inserted a hydrophilic guidewire (Radifocus; Terumo Co. Ltd., Tokyo, Japan) into the bile duct (Fig. 3a). Then, the guidewire was inverted in the bile duct by the inflated balloon, thereby successfully advancing into the cystic duct (Fig. 3b). After the hydrophilic guidewire was inserted into the gallbladder (Fig. 4a), it was changed to a stiff type. Finally, we placed a spiral-shaped plastic stent [4], positioning the tip at the gallbladder fundus (Fig. 4b). This case shows that the balloon occlusion method can be useful to successfully perform ETGBD, particularly in patients with caudal distribution of the cystic duct (Video 1).
Fig. 4a The guidewire was inserted into the gallbladder through the cystic duct. b The spiral-shaped stent was placed in the gallbladder.
