Refractory esophagopleural fistula post-lobectomy successfully treated by endoscopic submucosal dissection and over-the-scope clip

Acquired esophagopleural fistulas are rare adverse events of pneumonectomy and occur in 0.2 to 1% of cases [1]. The operative treatment of esophagopleural fistulas includes esophagostomy, gastrostomy, possibly local drainage, or thoracotomy and radical operation [2, 3] with high morbidity and mortality. Reports of endoscopic closure of such large post-operative fistulas are rare or very expansive devices like the Amplatzer atrial septal closure device are used [4]. Endoscopic submucosal dissection (ESD) achieved closure of fistulas of different etiologies and thus represents a hopefully low-invasive solution [5].

We present the case of a 68-year-old patient who underwent a middle lobectomy for lung cancer complicated with a large esophagopleural fistula on day 8 with purulent pleurisy and right lung abscess. First of all, a 3-month derivation with an esophageal metal stent was attempted but failed. Then, drainage of the fistula with a Kehr's drain (thoracic approach) failed to improve sepsis. A few months later, once the fistula orifice was less inflammatory, the patient was referred to our unit for closure of the orifice using ESD with a clip-and-line traction for the deepest removal possible of the scarring mucosa in the fistula tract (▶ Fig. 1, ▶ Fig. 2, ▶ Video 1). Then we closed the fistula orifice with an over-the-scope clip (OTSC) placed on the submucosa. In order to protect the ESD, a covering esophageal stent was dropped at the end of the procedure. Six weeks later when the stent was removed, the OTSC clip was already unfixed and the fistula had completely healed without leakage.

ESD followed by OTSC closure and a covering esophageal stent appears to be an effective choice to achieve endoscopic closure of an esophagopleural fistula owing to its non-invasiveness and low morbidity. It should be fully considered among other treatments, even if its...
A place remains to be defined in the therapeutic strategy by prospective studies.
