Pd-Catalyzed Direct Alkynylation of Aliphatic C–H Bonds

Significance: The first palladium-catalyzed alkyynylation of unactivated C(sp³)–H bonds in aliphatic carboxylic acid derivatives has been disclosed. 8-Aminoquinoline proved to be the best directing group to promote the desired alkynylation reaction.

Comment: Interestingly, replacement of the 8-aminoquinoline moiety with a 1-aminonaphthyl group or N-methylation of the amide group completely inhibited the ethynylation reaction, indicating that both, the nitrogen of the quinoline moiety and the NH group of the amide are essential for the reaction.
