**Nitrogen-Free [18]Porphyridoids in Two Steps**

**Significance:** The researchers synthesized substituted and unsubstituted dioxadicarbaporphyrins, which are the first examples of porphyrinoids with adjacent indenes. Bis(3-indenyl)methane 1 was reacted with various aryl aldehydes to yield compounds 3. Reaction with formaldehyde or an aryl aldehyde followed by oxidation led to the formation of dioxadicarbaporphyrins 5 and 6, respectively. These bilin analogues are interesting as natural products as well as organic opto-electronic materials.

**Comment:** The reaction of bis(3-indenyl)methane 1 with aryl aldehydes was expected to give a symmetric difulvene; however, the fully conjugated derivative 3 was obtained instead and confirmed with 2D NMR and X-ray crystallography. The \(^1\)H NMR spectra of the porphyrinoids 5 and 6 displayed that the macrocycles are diatropic, as expected from the [18]annulene core.
