

Aerobic Oxidation of Alcohols with MoS₂/Ta₃N₅ Nanocomposites

Selected results:

Oxidation of amines, sulfides, and alkenes:

Significance: Ta₃N₅ nanoparticles partly coated with a MoS₂ layer (MoS₂/Ta₃N₅ NPs) were prepared by hydrothermal treatment of Ta₃N₅ NPs with (NH₄)₆Mo₇O₂₄ in the presence of thiourea (eq. 1). MoS₂/Ta₃N₅ NPs catalyzed the aerobic oxidation of alcohols under oxygen (1 atm) to give the corresponding aldehydes or ketones in up to 99% conversion with 99% selectivity (13 examples, eq. 2).

Comment: MoS₂/Ta₃N₅ NPs were characterized by SEM, TEM, XRD, ICP-AES and elemental analysis. The catalyst also promoted the aerobic oxidation of amines, sulfides, and alkenes to afford the corresponding imines, sulfoxides, and epoxides (eq. 3). In the oxidation of benzyl alcohol, the catalytic activity of MoS₂/Ta₃N₅ NPs was superior to that of Ta₃N₅ NPs and MoS₂.
