

# Biogenetically Inspired Synthesis of Indole Alkaloids

**Significance:** Oguri and co-workers report elegant and concise syntheses of several types of indole alkaloids. Their biogenetically inspired strategy relies on the use of a dihydropyridine intermediate that enables access to five skeletally distinct scaffolds.

**SYNFACTS Contributors:** Erick M. Carreira, Simon Krautwald

**Comment:** The key and multipotent intermediate **D** was prepared from **C** by copper-catalyzed dihydropyridine formation. By judicious choice of conditions, **D** could be converted into three structurally distinct natural products in very few steps.
