Endoscopic salvage technique for spontaneous dislocation and tumor ingrowth of a partially covered, self-expandable metallic stent after endoscopic ultrasound-guided choledochoduodenostomy

A 67-year-old woman with metastatic cancer of the pancreatic head was admitted to our hospital with obstructive jaundice. She underwent EUS-CDS using a PCSEMS (WallFlex stent, 10×60 mm; Boston Scientific Japan, Tokyo, Japan) without complication (Video 1). Seven months later, she developed acute cholangitis. The PCSEMS had dislocated, as was confirmed on computed tomography (Fig. 1). Our first attempt was to try to extract the PCSEMS using a snare, but this failed because of tumor ingrowth into the uncovered portion. In our next attempt, the PCSEMS was partially trimmed using argon plasma coagulation with an electro surgical generator (ICC 200; Erbe Elektromedizin, Tübingen, Germany) at 80W and with a flow rate of 2 L/min (Fig. 2). ERC revealed a stricture of the PCSEMS caused by tumor ingrowth (Video 2). In our third attempt, we dilated the stricture using a 6-Fr wire-guided diathermic dilator (Cysto-Gastro-Set; Endo-Flex, Voerde, Germany) using an EGS-100 electrosurgical generator (Olympus, Tokyo, Japan; 30W in pulse cut slow mode) (Fig. 3, Video 2). Finally, a 6-Fr uncovered SEMS (Zilver 635 stent; 10 mm × 60 mm, Cook-Japan, Tokyo, Japan) was placed without complication (Fig. 5, Video 2).

Endoscopic ultrasound-guided choledochoduodenostomy (EUS-CDS) has been established as an alternative method of biliary drainage after failure of endoscopic retrograde cholangiopancreatography (ERCP) [1,2]. Because of its prolonged stent patency and reduced bile leakage, use of the covered self-expandable metallic stent (CSEMS) has recently been favored. We present a case of spontaneous dislocation of a partially covered SEMS (PCSEMS) after EUS-CDS that was successfully rescued by endoscopic intervention.
Spontaneous dislocation of a PCSEMS after EUS-CDS is a very rare complication [1, 2]. In the case described here, we successfully mitigated this situation using endoscopic intervention. In particular, a diathermic dilator is useful for dilating severe stricture over a guidewire under fluoroscopic guidance.
