Stereoselective Lithiation and Carboxylation of Boc-Protected Bicyclopyrrolidine: Synthesis of a Key Building Block for HCV Protease Inhibitor Telaprevir

Org. Process Res. Dev. 2014, 18, 1234–1244.

Synthesis of a Key Building Block for HCV Protease Inhibitor Telaprevir

Significance: The target molecule **H** is a fragment of the HCV protease inhibitor telaprevir. A large-scale process for the synthesis of **H** entails a stereoselective lithiation–carboxylation of **A** to give *rac*-**C** followed by a resolution with (*S*)-1,2,3,4-tetrahydronaphthalen-1-amine (**D**). Two hundred kilograms of the target molecule **H** were manufactured in 27% overall yield by this route.

Comment: An enantioselective synthesis of **C** via asymmetric lithiation–carboxylation using a variety of chiral diamine ligands was also investigated. For example the chiral diamine ligand (–)-cystine developed by O'Brien and co-workers (*J. Am. Chem. Soc.* 2002, 124, 11870) provided *ent*-**C** in 44% yield and er > 99:1 after crystallization. However, this route was not pursued owing to the high cost and uncertain supply of (–)-cystine.
