Abstract

The topic of generational differences has received a great deal of attention in the workplace; however, very few papers have addressed the topic of how this new generation, the Millennials, have merged into the health care arena. While medical schools continue to admit the most talented students, the Millennials grew up in an environment that was markedly different than those of most physicians and patients. In many ways, these young physicians fit nicely into the changing environment of health care. They work well in interdisciplinary teams, are technology experts who are easily able to access knowledge, and coordinate patient care. They are known to be team players, safety oriented, optimistic, and civic minded. On the other hand, there are some characteristics of this group that may present challenges to older generations. These individuals were raised in a booming economy and were often showered with praise. Our standard approaches to educating residents are no longer ideal. Our newest learners in the health care arena require novel approaches to feedback, mentoring, teaching and learning, and work–life balance. The purpose of this article is to provide academic medical educators the necessary tools to maximize the education of this generation, which will in turn improve patient care.

► learning
► mentoring
► work–life balance

A new generation of men and women, the Millennials, are entering our residency programs and these young physicians learn and work in ways that are remarkably different than the cohorts of the past three generations. Therefore, it is important to have an understanding of the general characteristics of the Millennials and the other three generations because the differences, particularly in regard to the Millennials, will have a significant impact on both the delivery of health care and how the different generations interact within academic medical organizations. Next, one must then learn how to maximize the teaching and learning environment for the Millennials in our residency programs.

While it is important to understand the qualities of all four generations, one must keep in mind that not all individuals of a generation have precisely the same characteristics and many individual qualities are the result of parenting styles. There are currently four generations in the workforce: Traditionalists, Baby Boomers, Generation Xers, and Millennials. The Traditionalists, also known as the “silent generation,” were born between 1925 and 1945. Typically, they are all work and no play doctors. They are the Professor Emeriti and senior faculty members, who have wisdom, a strong work ethic, and loyalty to their jobs; you can count on them. However, they may lack knowledge of the latest technological advances and are often perceived as too formal.

Next, the Baby Boomers, born after World War II (between 1946 and 1964), are generally the midlevel and senior faculty members, often the leaders in our departments. The Baby Boomers are considered workaholics who are extremely dedicated, ambitious, idealistic, and competitive. Their careers often define them and provide their identity. Therefore,
they have little understanding of work–life balance; another
all work and no play group.

Declaring their independence, the Gen Xers, born between
1965 and 1979, are junior and midlevel faculty members
and some residents. They tend to be more cynical, distrust
authority, and believe that there is more to life than work.
Since they believe that family is a priority, they want balance
between work and life and dislike rigid work requirements.
They often seek out feedback and tend to rely on technology
for communication more so than the Traditionalists or
Boomers.

Finally, the Millennials, or Generation Y, our current
residents and medical students, were born in 1980 to 2001.
These individuals grew up in a booming economy and there-
fore are often accustomed to the best and have a sense of
entitlement. They have been called the “child-centric gener-
ation” because they were raised with close parental involve-
ment (the so-called helicopter parents). As children, they
were showered with constant praise and therefore may be
overly confident. On the other hand, Millennials have many
positive attributes. They are team oriented, safety oriented,
optimistic, civic minded, and want to make the world a better
place. They require immediate access to technology, tend to
have shorter attention spans, and necessitate talented in-
structors to persuasively engage these students.¹

Armed with solid demographic information, a good teach-
er can create learning activities and bedside instruction based
on the traits that most characterize the generation. Our
standard approaches to educating residents are no longer
ideal. Our newest learners in the health care arena require
novel approaches to feedback, mentoring, teaching and learn-
ing, and work–life balance. If faculty wants to succeed in
ensnaring this group, they must get creative with their
approach to learning.

Feedback and Mentoring

Using appropriate strategies for feedback to Millennials, who
are new to the professional arena, will generally create a more
positive learning environment. First, it is essential to create a
culture of feedback from the first day in the residency
program. One must act as a mentor and explain to residents
that they will, without a doubt, receive criticism throughout
their training to make them the best doctors possible. It is
essential that faculty remind them of this fact many times
within the residency. At the same time, it is important
to provide a set of expectations that will guide the develop-
ment of the residents’ attitudes, knowledge, and skills.²

As mentioned previously, the Millennials are considered
by some to be “praise junkies” and are accustomed to frequent
positive feedback.³ They are “success stories” with impressive
resumes reflecting confidence, accomplishments, and intel-
ligence. They want to do it right the first time. Because of these
early experiences, they may interpret negative feedback as
failure and may not be aware or even recognize their own
poor performance. At the same time, Boomers and Gen Xers
may be uncertain as to how to provide constructive feedback
to this generation and to acknowledge the difference in
learning preferences. One should give praise when the resi-
dent truly deserves it but be careful to soften the negative
feedback because acceptance and others’ perception of them
are highly important to this generation. Methods of feedback
that worked well with prior generations (i.e., the Tradition-
alist’s “bootcamp style” where no news is good news or the
Gen-Xer’s blunt and undiplomatic feedback) do not tend to
work well with the Millennials.

The Millennial mantra of “I can do no wrong” does have
some advantages. While certainly off-putting to many, such a
response does not always have to be maladaptive. In fact, it
can be protective, keeping the young person from falling
apart during uncertainty and when the going gets tough.

These young men and women want to have a close
relationship with the program director and faculty. They
crave constant communication and connection. Millennials
are accustomed to “coaching” or “parenting” styles of feed-
back along with a lot of encouragement. This is best achieved
by taking a personal interest in the resident, and helping
them develop necessary skills while applauding them along
the way. Since the Traditionalists and Boomers often have
children that are of the age of residents, they are naturally
excellent mentors and often quite skilled at providing this
feedback. Another approach to mentoring is “Peer Mentor-
ing” where groups of peers work together to address profes-
sional development. The 360 Degree Evaluation, which often
provides the most reliable feedback of a resident, is a form of
peer mentoring that may be highly effective in your residency
program. Finally, experience suggests that “group mentoring”
when one or two more senior faculty meet with more junior
faculty/residents as a group is an effective form of feedback.
This diffuses the “chain of command;” reduces emphasis on
any one individual, and reduces time burden on any single
faculty member. An invitation to a potluck dinner at your
home can go a long way to promoting a strong relationship
within the residency.

Teaching and Learning Styles

Teaching and assessing learning in a multigenerational envi-
ronment can be challenging and therefore requires careful
contemplation. The challenge arises when the educator at-
ttempts to teach the Millennials by using teaching techniques
that worked for his/her generation but clearly do not work for
these young individuals.

The Traditionalists prefer the “traditional” classroom struc-
ture with lecture presentation and use of the Socratic process
for classroom learning, while the Boomers tend to enjoy lots of
interaction and “talk” time and prefer a spirit of collegiality. Gen
Xers, who are often impatient, prefer to get to the point and
move on as soon as possible. The Millennials are less accepting of
these traditional teaching methods. If one is serious about
engaging these learners, they will have to create an experience
the learners will want to share. By focusing efforts on experien-
tial learning and incorporating a sense of responsibility, the
teacher will better connect with these learners.

The learning style of the Millennial is quite different than
the other generations. Millennials are intuitive visual
communicators and when they must hear a lecture, these students respond to pictures, graphics, and short video segments like those found on YouTube. In addition, they are explorative, experiential, hands-on learners, who learn better by discovery than being told.

While many Millennials are highly intelligent, they may also have little desire to listen to long lectures or read long texts. Lecturers should consider delivering talks in shorter segments and incorporate more material that can be delivered via media such as videos and interactive formats. While many question the Millennials’ ability to multitask, it is certainly true that they can shift their attention easily from one thing to another. While they may think nothing of sending a text message during a lecture, or researching a diagnosis at the bedside, their “multitasking” may be considered rude or that of disinterest. In addition, they prefer educational material that can be delivered to the device in front of them. Therefore, it is essential that educators incorporate up-to-date technology, such as online modules and Podcasts, into learning. Lastly, Millennials prefer a “blended” education, education that is also entertaining, referred to as “edutainment.”

Educating Millennials in the classroom carries its own set of challenges, but teaching residents in the clinic also requires new strategies. First, it is important for the program director to provide explicit and clearly stated goals and expectations for the residents. The Millennials respond well to very specific instructions, especially when the relevance of the material is also explained. They learn best when the learning activities are structured but also more interactive. While they prefer to have all the answers immediately at hand, the practice of medicine does not always provide that opportunity. Therefore, it is essential that we teach resourcefulness and remind the residents that sometimes information is lacking; decisions are complex, and the diagnosis in not clear. Since Millennials are extraordinary team players, we should encourage them to find solutions as a team. In addition, Millennials appreciate checklists when appropriate because the structure provides them with clear expectations and goals to achieve. This same structure should also be provided in educational objectives, handbooks, dress code, as well as email, telephone, and texting etiquette. It is often useful in a residency program to offer workshops on communicating with faculty and patients across generations.

In summary, Millennials are accustomed to group work, comfortable with active learning, and multitask with ease. They are technological experts, goal and achievement oriented, and enjoy personal interaction and a sense of community. These strengths can be emphasized by using the Millennials to provide technology tutorials to older generations and tap into their global connections for research, information, and education.

**Work–Life Balance**

One of the biggest challenges that we face as teachers of medicine is the emphasis of the Millennials on work–life balance. It is often referred to as “work–life blend” because this generation tends to blend personal interests into the workday, and work activities into the evenings. While this may work satisfactorily in the business world, it presents challenges in medicine because of medical emergencies and responsibility to patients. With the increased emphasis on duty hours and physicians’ desire for more clearly defined work hours, medicine is naturally developing a more “shift-work” mentality which lends itself nicely to the priorities of the residents. Unlike the Boomers, the Millennials are unwilling to trade their values for their image. This generation values individuality, as long as they are considered part of a group.

At the same time, more women are graduating from medical schools and have the added responsibility of childbearing, and today’s parents are in many cases equally responsible for child care. Changes in the medical culture, such as increasingly strict duty hour regulations, night float systems, and additional physician extenders, are encouraging more balance in residents’ lives. These trends lead to a more team-based approach to health care delivery, where nurse practitioners, technicians, and physician assistants share and take greater responsibility for patient care.

In the recent 2010 Flexner report, Changes in Physician Culture: 1910 versus 2010 Flexner Report, it is reported that the 20th century physician was more of an individual scholar or solo expert who worked in a physician-centered environment. These doctors worked autonomously, accumulated knowledge, and worked toward individual achievement. In contrast, the 21st century physicians now work in interdisciplinary teams and coordinate patient care in a patient-centered environment. These physicians acquire and utilize knowledge, collaborate with other health care providers, and have a shared accountability for patient care.

As the individual resident prefers a work–life blend, residency program directors must find innovative ways to provide patient care and yet allow residents the balance and time for rest and family. Programs should have systems in place to manage emergencies and have clearly defined leave policies so that residents understand the procedures that are to be followed when they have a sick parent or child and must leave clinic to care for them. Resource guides with clearly defined policies and information about child care, pediatricians, babysitting, wellness centers, etc., are extremely valuable to residents and program directors. In addition, hospitals may soon develop more family- and employee-friendly arrangements for resident physicians. Finally, the Millennials are a global and generous generation who thrive on opportunities for medical missions. Providing opportunities for overseas missions also encourages work–life balance and a sense of the greater health care community.

The diversity of generational values that exist in the medical centers creates occasional challenges but also provides many opportunities. An understanding of the Millennial’s life experiences will assist faculty in being leaders and mentors to this group. The Millennials fit nicely into the changing health care environment in many ways. Their notions of teamwork, technological acumen, and generosity will be beneficial to older physicians and the changing health

care environment. These new physicians will force faculty to sharpen communication skills, particularly with text messaging, social networking, and more interactive educational formats. Learning to identify generational differences and apply strategies to overcome differences will promote and improve learning environments for all generations, which will ultimately improve patient care.
