 Total Synthesis of Hybridaphniphylline B  
*J. Am. Chem. Soc.* **2018**, *140*, 4227–4231.

## Syntheses of *Daphniphyllum* Alkaloids

**Significance:** The first total synthesis of (–)-hybridaphniphylline B in addition to three other *daphniphyllum* alkaloids was accomplished. The synthetic strategy relied on a biomimetic Diels–Alder cycloaddition to forge the stereochemically dense decacyclic skeleton.

**Comment:** Utilizing previously synthesized **A** (*J. Am. Chem. Soc.* **2017**, *139*, 14893), hexacycle **D** was accessed in eleven steps through an optimized Claisen rearrangement. **D** served as a common intermediate for the synthesis of four natural products.
