Abstract A facile synthesis of 2,3-disubstituted carbazoles through electrocyclization of 2,3-divinylindoles using FeCl₃ in DMF at reflux is reported. The methodology was found to be applicable for smooth transformation of 3-aryl-2-vinylindole as well as 2-styrylbiphenyl into the respective benzo[*c*]carbazole and phenanthrene.

Key words carbazoles, electrocyclization, Iron(III) chloride, 2,3-divinylindole, benzocarbazole, phenanthrene

Over the years, our research group has exploited electrocyclic cyclization of 1-phenylsulfonyl-2,3-divinylindoles as a key step for the syntheses of quinocarbazoles,^{1a} staurosporine aglycone,^{1b,1c} and also for accessing a wide variety of substituted carbazoles.² We have also accomplished a Lewis acid mediated electrocyclization strategy for accessing calothrixin B and its derivatives.³ In all these reports, the thermal electrocyclization followed by aromatization of 2,3-divinylindoles could be performed using 10% Pd/C in xylenes at reflux to give the respective carbazoles in good yields. However, the inconsistent quality of 10% Pd/C, difficulty in the aromatization of intermediate dihydrocarbazole, coupled with prolonged reaction time at elevated temperature, makes this protocol unsuitable for performing the reaction on a multi-gram scale. We sought to develop an alternative procedure that avoids the use Pd/C and also overcomes the disadvantages noted above. Hence, in a further continua-

tion of our work on the synthesis of carbazoles,^{1–3} we report herein the synthesis of a wide variety of carbazole derivatives **2** through FeCl₃-mediated^{4,5} electrocyclization as a key step. The synthesis of benzo[*c*]carbazoles **3** could also be achieved from the respective 2-vinyl-3-arylindoles (Scheme 1).

Scheme 1 Synthesis of carbazoles **2** and **3** using FeCl₃-mediated cyclization

To realize this objective, the required 2,3-divinylindoles **1a–v** were prepared (Scheme 2) from the respective phosphonate esters.⁶ As a representative case, thermal electrocyclic cyclization of **1a** in the presence of anhydrous FeCl₃ in anhydrous DMF at reflux for 6 h afforded 2-nitrophenyl carbazole **2a**⁷ in 74% yield (Scheme 3).

To our delight, FeCl₃-mediated electrocyclization of a wide variety of 2,3-divinylindoles could be smoothly performed to afford the respective carbazoles.

Scheme 2 List of 2,3-divinyliindoles **1a–v**Scheme 3 FeCl_3 -mediated electrocyclization of divinyliindole **1a**

The structures of various types of divinyliindoles employed and the resulting carbazoles obtained are presented in Table 1. The reaction of 1-phenylsulfonyl-2,3-divinyliindoles **1b–d** with FeCl_3 in anhydrous DMF at reflux afforded carbazoles **2b–d** in 71–78% yields, respectively (entry 1). The FeCl_3 -mediated electrocyclization could be smoothly performed with 2,3-divinyliindoles **1e–k** to afford the expected 4-methylcarbazoles **2e–k** in good yields (entry 2). However, the reaction was found to proceed slowly with 2,3-divinyliindole **1l/1m**, containing a phenyl or *p*-anisyl unit, yielding the respective carbazole **2l** and **2m** in 43% and 38% yields (entry 3). The isolation of compounds **2l** and **2m** in low yields confirms that the electron-donating nature of the aryl unit present in 2,3-divinyliindole **1l** or **1m** is not conducive for the FeCl_3 -mediated electrocyclization reaction. As expected, the 2,3-divinyliindoles **1n–q**, containing a cyanovinyl unit, upon reaction with 50 mol% FeCl_3 in DMF at reflux furnished the respective 3-cyano-2-(2'-nitrophenyl)carbazoles **2n–q** in 78–82% yields (entry 4). Under identical conditions, the isomeric 3-(2'-nitrophenyl)-vinylindoles **1r–v**, containing 2-vinyl ester as well as a 2-vinyl cyanide unit, could be smoothly transformed into the appropriate carbazoles **2r–v** (entries 5 and 6).

The synthesis of benzo[*c*]carbazole analogues employing the FeCl_3 -mediated cyclization was then initiated. Accordingly, Wittig–Horner reaction of phosphonate ester **4**⁶ with substituted benzaldehydes in the presence of NaH in tetrahydrofuran (THF) at 0 °C for 3 h afforded 3-bromo-2-

aryliindoles **5a** and **5b**. As expected, the Suzuki coupling of bromo compound **5a/5b** with aryl boronic acid using $\text{Pd}(\text{PPh}_3)_4$ and Na_2CO_3 in 1,2-dimethoxyethane (DME) at reflux furnished 3-aryl-2-styryliindoles **6a–d** as colorless solids in good yields. As expected, the reaction of **6a–d** with 50 mol% FeCl_3 in anhydrous 1,2-dichloroethane (DCE) at room temperature or at reflux furnished 2-aryl benzo[*c*]carbazoles **3a–d**⁷ in good yields (Scheme 4).

Scheme 4 FeCl_3 -mediated cyclization of 3-aryl-2-vinyliindoles **6a–d**

Subsequently, 3-bromo-2-methylindole, upon benzylic bromination followed by hydrolysis and MnO_2 oxidation of corresponding alcohol, led to 3-bromoindole-2-aldehyde **7**. The Suzuki coupling of bromo compound **7** with veratryl boronic acid using $\text{Pd}(\text{PPh}_3)_4$ in the presence of K_3PO_4 in DME reflux afforded 2-formyl-3-aryliindole **8** as a colorless solid in 87% yield. Indole aldehyde **8**, upon Wittig reaction with (carbethoxymethylene)triphenylphosphorane in

			1v/2v R ¹ =F, R ² =H

^a Reactions were carried out using **1a–v** (1 equiv), FeCl₃ (0.5–2 equiv) in DMF (10 mL) at reflux for 3–12 h.^b Isolated yield by column chromatography.

anhydrous CH₂Cl₂ at room temperature, led to 3-veratryl-2-vinylindole **9** in 93% yield. The 2-vinyl ester **9**, upon cyclization using 50 mol% FeCl₃ in anhydrous 1,2-DCE reflux, furnished benzo[*c*]carbazole **10** in a moderate yield (Scheme

5). Attempts to improve the yield of the benzo[*c*]carbazole **10** either by increasing the number of equivalents of FeCl₃ or by prolonging the reaction time was not found to be useful.

Next, the Wittig–Horner reaction of phosphonate ester **11**⁸ with 2-bromo-veratraldehyde **12** in the presence of *t*-BuOK in toluene at reflux afforded vinyl compound **13**. As expected, the Suzuki coupling of **13** with boronic acids furnished the required triene compounds **14a** and **14b** in 85% and 91% yields. The triene framework of **14a** and **14b** underwent cyclization upon interaction with 50 mol% FeCl₃ in anhydrous 1,2-DCE at reflux to give 9-arylphenanthrenes **15a**⁷ and **15b** in 62% and 65% yields, respectively (Scheme 6).

In summary, we have achieved the syntheses of 2,3-disubstituted carbazoles, benzo[*c*]carbazoles, and phenanthrene derivatives by employing FeCl₃-mediated cyclization of the corresponding triene frameworks. For the first time, the FeCl₃-mediated cyclization of two vinylic carbons as well as phenyl and vinylic carbons could be achieved in acceptable yields.
