Hydrogen Bonding Phase-Transfer Catalysis with Potassium Fluoride: Enantioselective Synthesis of  $\beta$ -Fluoroamines  
*J. Am. Chem. Soc.* **2019**, *141*, 2878–2883.

# Hydrogen-Bonding Phase-Transfer Catalysis toward $\beta$ -Fluoroamines

**Significance:** Gouverneur and co-workers report a nucleophilic fluorination of  $\beta$ -chloroamines by using a chiral bisurea catalyst and KF or CsF as a solid source of fluoride in hydrogen-bonding phase-transfer catalysis (HB-PTC). Both fluoride sources are easy to handle, nontoxic, and cheap in comparison with other fluorination reagents. The  $\beta$ -fluoroamines were obtained in high yields and high enantioselectivities, and, for some examples, on a large scale.

**Comment:** The concept of HB-PTC was recently applied to nucleophilic fluorination reactions by the authors (*Science* **2018**, *360*, 638). On the basis of this work, they were able to further decrease the cost of the fluoride source, without loss of enantioselectivity, by using KF. Furthermore, the authors approached a broader scope by using aziridinium ion precursors, which led to the synthesis of several fluoro derivatives of approved drugs (e.g., diphenidine).
