**Total Synthesis of Isochrysohermidin**

**Significance**: In 1993, Boger and Baldino described a concise synthesis of isochrysohermidin, a 2-oxo-3-pyrroline dimer first isolated from *Mercurialis leiocarpa*. Through their synthetic efforts, they were able to show the interstrand DNA cross-linking capabilities of isochrysohermidin.

**Comment**: C is accessed from A by an inverse-electron-demand Diels–Alder cycloaddition with B and is further elaborated to D by reductive ring contraction. *meso-* and *d,l-*isochrysohermidin are obtained by a singlet oxygen cycloaddition, followed by in situ decarboxylation.
