Gastric cancer is second most common cause of cancer related death in Indian men and women aged between 15 to 44 years.1 There is significant regional variation in gastric cancer incidence, with higher incidence being reported from north-eastern and southern parts of India.2 Most patients present at an advanced stage of disease. Surgically resectable disease usually requires a standard gastric resection and D2 lymphadenectomy. Imaging, especially with computed tomography (CT) scan of abdomen as well as thorax, is necessary for localization, nodal mapping and metastatic work-up of gastric cancer.2 Literature on imaging of gastric malignancy with Indian perspective is fairly in number. This issue of JGAR focuses on diagnosis and pretreatment mapping of gastric malignancy, including mesenchymal tumors. Awiwi et al discusses imaging of the primary gastric tumor1 and Maru et al outlines the imaging of lymph nodes.4 Andhalgaokar et al presents a detailed discussion on mesenchymal tumors of the stomach and duodenum.5 Continuing the trend from our last issue, we are rounding things up in the duodenum section with a thorough review of ampullary and periampullary conditions by Sunnapwar et al.6

In this issue, Selvaraj et al presents their original research on the comparison between conventional and virtual unenhanced images in dual-energy CT in the evaluation of hepato-biliary and pancreatic diseases.7 Helavar et al reviews portal gastroduodenopathy.8 We have also included three case reports in this issue, which presents brilliantly educational images. Ginting et al presents a truly deceiving case of mesenteric lymphatic malformation by Prasad et al reminds us of the importance of classic signs as well as advanced imaging.9 In their report, Varatharajaperumal et al shows the importance of knowing the clinical context in a seemingly simple imaging presentation.10

We thank our readers, authors, reviewers, and editors for all of their valuable support. We look forward to more exciting research articles and excellent reviews.
