Klippel–Trenaunay syndrome: endoscopic findings

A 44-year-old man with no relevant past medical history was referred for colonoscopy because of recurrent hematochezia and iron deficiency anemia. He reported no abdominal pain or weight loss. He had been on oral therapy with ferrous sulfate. A hypertrophic lower left limb was seen on physical examination. Colonoscopy (Video 1) revealed ectasia and congestion of the submucosal and mucosal venous vessels and hemangiomas affecting the rectum and the left colon in a 44-year-old man with Klippel–Trenaunay syndrome.

Endoscopic finding of ectasia and congestion of the submucosal and mucosal venous vessels and hemangiomas affecting the rectum and the left colon in a 44-year-old man with Klippel–Trenaunay syndrome. (Fig. 1)

Intraoperative findings of (a) normal vascular pattern in the transverse colon and (b) numerous venous varicosities in the rectum and the left colon. (Fig. 2)

Video 1

Klippel–Trenaunay syndrome: endoscopic findings in a 44-year-old man. Colonoscopy revealed ectasia and congestion of the submucosal and mucosal venous vessels and hemangiomas with a continuous pattern, affecting the rectum and the left colon with normal vessels in the transverse colon.

In this patient, endoscopic and angio graphic treatments were not feasible and the severity of symptoms forced an early surgical approach. The endoscopic findings associated with Klippel–Trenaunay syndrome are highlighted.
