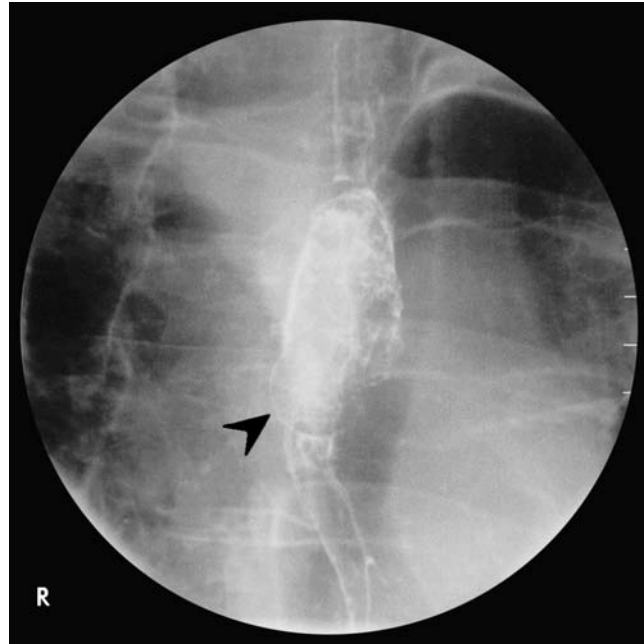

Figure 1 A 55-year-old woman was referred to our endoscopy unit with a 1-month history of continuous retrosternal pain, dysphagia, and odynophagia located in the upper half of the esophagus. She had been suffering from these symptoms after swallowing three pills at once because of a troublesome headache. As she was in a hurry, she did not notice that one of them was still in its plastic cover. On barium meal examination, the pill was seen as a sharply radiolucent, round, filling defect (indicated by black arrowhead) in the upper thoracic esophagus. It was removed by endoscopy.

Figure 2 The size of the plastic-covered pill, 2 cm in diameter.
