Int. J. Sports Med. 10 (1989) 53–54

The data reported in Table 2 were obtained applying corrective factors ($PCr/ATP = 1.43$; $Pi/ATP = 1.15$; $PCr/Pr = 1.17$ which reflect the differential saturation effects due to the incomplete recovery during the repetition time between pulses. These corrective factors were experimentally determined from spectra runned with a repetition time of 30" between pulses.
