Abstract

The present paper is a continuation of our study on the Chinese traditional herb Artemisia annua L. [1—5], describing several additional constituents: quinghaosu IV and V (V, VII), quinghao acid (VIII) [6], chrysosplenol (VIa) [7] and a paraffinic alcohol; V, VII and VIII are compounds with unreported structures.

Introduction

A number of our earlier papers have been devoted to studies of chemical constituents isolated from Artemisia annua L. (Compositae), the most notable constituent being the antimalerial quinghaosu (I) [1—4], a peroxicid lactone with unique structure. Other constituents include quinghaosu-I-III (II—IV), a flavonol (VI), scopoletin and a few terpenes from the essential oil [5].

This paper deals with the isolation and characterization of V, VIa, VII, VIII and a paraffinic alcohol.

It is pertinent here to point out the close stereochemical kinship among the previously established structures I—IV. They all belong to the amorphane series (IX) [9], which has a cis decalin skeleton with the isopropyl group trans to the hydrogen on the ring juncture. Compounds I and IV are further distinguished by the presence of a modified seven-membered A-ring as the result of insertion of an extra ether oxygen.

1 For Part I, see ref. 5.
Results and Discussion

Qinghaosu-IV (V) is a colourless crystalline compound with m.p. 172–173°. MS molecular weight 282 (M+) agreed with C_{15}H_{22}O_{3}. Hydroxy and lactonic carbonyl groups can be inferred from its IR spectrum (3450, 1728 cm\(^{-1}\)). The \(^1\)HNMR spectrum displayed the following features: \(\delta 0.95 (d, J = 6 Hz, 10-CH_3)\), \(1.20 (d, J = 6, 11-CH_2)\), \(1.65 (s, 4-CH_3)\), 3.20 (m, H-C-11), 3.60 (br, H-C-3), 5.60 (s, H-C-5) and an exchangeable OH group at 1.88. Except for the two signals at \(\delta 1.88\) and 3.60, the NMR spectra of IV and V are almost superposable, thus leading to the conclusion that the extra oxygen of VI is in the form of a hydroxy group with only four possible places (C-2, 3, 8 and 9) for its accommodation. Eu(fod)\(_3\) was used for its allocation. Addition of successive aliquots of the shift reagent gave rise to linear changes of chemical shifts. In the case of qinghaosu III (IV), we have for 10-CH\(_3\), \(\delta 0.95 \rightarrow 0.96 \rightarrow 1.16 \rightarrow 1.16\); for 11-CH\(_3\), 1.20 \(\rightarrow 1.42 \rightarrow 2.20 \rightarrow 2.40\); for 4-CH\(_3\), 1.54 \(\rightarrow 1.55 \rightarrow 1.74 \rightarrow 1.75\); and for H-C-5, 5.55 \(\rightarrow 5.75 \rightarrow 6.20 \rightarrow 6.40\). Qinghaosu IV (V) gave the corresponding shifts: 10-CH\(_3\), \(\delta 1.04 \rightarrow 1.46 \rightarrow 1.77 \rightarrow 2.15\); 11-CH\(_3\), 1.27 \(\rightarrow 1.99 \rightarrow 2.60 \rightarrow 3.42\); 4-CH\(_3\), 1.65 \(\rightarrow 3.93 \rightarrow 5.74 \rightarrow 7.25\); H-C-5, 5.70 \(\rightarrow 6.91 \rightarrow 8.06 \rightarrow 9.18\). The marked shifts for 4-CH\(_3\) and H-C-5 in compound V is compatible only with an OH group at position-3, and the W\(_1/2 6 Hz\) of the H-C-3 multiplet (hence equatorial) indicates an \(\alpha\)-orientation for the OH group (axial). The structure of IV has been firmly established by its preparation from qinghaosu (I) by catalytic hydrogenation [5].

Chrysosplenol (6a) has very similar UV and \(^1\)HNMR spectra to eupatin (3, 5, 3'-triOH, 6, 7, 4'-triOMe) [7]. However, large discrepancies in m.p. of the acetates (155–157°; 219–221° for eupatin acetate) indicated the possible contamination by a C\(_{26}\) alcohol from the same species, using elemental analysis as the main evidence. Since C\(_{26}\) alcohol from the same species, using elemental analysis as the main evidence. Since C\(_{26}\) and C\(_{28}\) alcohols cannot be adequately differentiated by elemental analysis, there is room for the possibility of their sample being octacosanol.

Experimental

Melting points were not corrected. IR spectra were taken with KBr discs on an IR-S spectrometer. \(^1\)HNMR spectra were taken with CDCl\(_3\) solutions on WH-90, with TMS as the internal standard. MS were recorded with MM70–70H spectrometer.

Plant Material

Artemisia annua L. is a regular commodity, available in practically all warehouses for Chinese herbs. However, there might well be variations in chemical constituents with different localities, which were therefore specified below.

Silica gel columns and plates were used and eluted with the mixed solvent of petroleum ether and ethyl acetate in individually specified proportions.
Qinghaosu-IV

Plant material from Sichuan Province was extracted with petroleum ether and the solvent removed. The crude extract was chromatographed. Qinghaosu-IV came down only when the mixed solvent was of 9:1 proportion.

The crude qinghaosu-IV displayed only a single spot on TLC (1:1 mixed solvent, 2 % phosphomolybdic acid spray). It was purified by recrystallization from ethanol. MS, m/e (%): 282 (M^+ 5), 238 (1), 222 (75), 207 (3), 204 (11), 194 (9), 178 (14), 166 (18), 150 (23), 137 (14), 122 (5), 107 (11), 93 (11), 81 (9), 74 (4), 69 (7), 55 (15), 43 (100). IR (cm^-1): 3480—2590, 1745 (M), 1645 (M), 1525 (M), 1445 (M), 1400 (w), 1380 (w), 1320 (w), 1274 (m), 1265 (m), 1220 (w), 1185 (m), 1170 (w), 1140 (m), 1080 (m), 1050 (m), 1015 (m), 970 (m), 940 (w), 920 (w), 880 (w), 820 (w), 785 (w), 715 (w), 695 (w), 675 (w), 715 (w).

Compounds VIa, VIII and the fatty alcohol were isolated from the plant material of the Beijing area. The ethereal extracts were shaken with 2 % aqueous sodium hydroxide, which upon acidification gave the crude acid fraction. From the chromatographic fractions with 95:5, 85:15 and 65:35 solvent compositions, were obtained qinghaosu-I (VIII), a fatty alcohol and chrysosplenol (VIa) respectively.

The non-acidic fraction from ether as mentioned above was concentrated, mixed with polyamide powder and percolated with 47 % ethyl alcohol. After stripping of solvent, the residue was extracted again with ether and the crude extract was chromatographed on a column. Qinghaosu IV came down from the 6:4 portion, showing one spot on TLC (1:1 mixed solvent, violet spot when sprayed with 2 % vanillin).

Qinghaos acid

The crude acid displayed a single spot on TLC (9:1 mixed solvent, 2 % vanillin-H_2SO_4 spray). It was purified by recrystallization from petroleum ether as transparent prisms, soluble in sodium bicarbonate. MS, m/e (%): 234 (M^+ 43), 219 (5), 216 (6), 206 (6), 201 (3), 189 (13), 178 (6), 173 (6), 161 (8), 147 (6), 136 (28), 121 (100), 105 (17), 93 (38), 87 (6), 71 (25), 67 (9), 55 (16), 41 (22). IR (cm^-1): 3480—2590 (s, br), 2550 (w), 1900 (w), 1690 (s), 1625 (m), 1445 (m), 1400 (w), 1380 (w), 1274 (m), 1210 (w), 1180 (w), 1155 (m), 1110 (w), 1080 (w), 1030 (w), 990 (w), 940 (m), 920 (w), 880 (w), 820 (w), 795 (w), 715 (w).

Dial from reduction of qinghaosu-I by LAH. The dial (1a) so obtained was an oil. ^1^HNMR: 0.85 (d, J = 6, 10-CH_3), 1.25 (s, 4-CH_3), 5.50 (br, H-C-3), 3.80 (d, J = 3.7-CH_2OH), 4.19 (br, H-C-5).

The fatty alcohol Crude product as one spot on TLC (9:1 mixed solvent, 5 % ethanolic phosphomolybdic acid spray). White powder from petroleum ether-chloroform. MS, m/e (%): 392 (9), 378 (2), 364 (22), 350 (2), 336 (14), 322 (2), 308 (4), 294 (3), 288 (3), 266 (3), 252 (4), 234 (2), 224 (4), 210 (5), 196 (6), 182 (6), 167 (11), 153 (14), 137 (21), 125 (37), 111 (58), 97 (97), 83 (100), 69 (75), 57 (92), 43 (75).

Chrysosplenol (VIa) Crude product as one spot on paper chromatography (Xinhua filter paper, 30 % acetic acid as eluant, 1 % AlCl_3 spray). Light yellow crystals from ethanol (twice), m.p. 221—223° (lit. 235—6° [7]). MS, m/e (%): 360 (M^+ 100), 359 (44), 346 (11), 345 (50), 343 (5), 342 (6), 341 (21), 332 (5), 317 (8). The triacetate had m.p. 155—157° (lit. 159—160° [7]). When fully methylated, m.p. 141—142°.

Qinghaosu V

The crude material was twice recrystallized from ethyl alcohol. MS, m/e (%): 250 (M^+ 24), 235 (7), 233 (6), 232 (15), 217 (7), 208 (18), 192 (18), 180 (15), 177 (10), 174 (8), 161 (11), 147 (15), 135 (16), 134 (12), 133 (13), 121 (15), 119 (15), 107 (26), 105 (19), 95 (27), 93 (27), 91 (31), 84 (13), 82 (23), 81 (28), 79 (28), 77 (20), 71 (35), 67 (25), 65 (10), 55 (32), 53 (30), 43 (100).

Acknowledgements

We thank Prof. T. J. MABRY of the University of Texas at Austin for a sample of eupatin. Liu Hongming of the Sichuan Institute of Chinese Materia Medica for the sample of 3,4-dioxybenzoic acid obtained on alkalifusion of chrysosplenol (identical IR with our sample) and our analytical colleagues for the recorded spectra.
