A 60-year-old woman presented with a history of pain in the back of the chest, with occasional cough, for the last 3 months. She had a history of a radical mastectomy for carcinoma of the right breast 17 years ago. The routine blood counts were within normal limits.

The patient underwent a contrast-enhanced CT scan of the chest [Figure 1A and B] and abdomen. A fine needle aspiration cytology (FNAC), using a 22-gauge spinal needle, was performed under CT guidance, which confirmed the diagnosis.

What is the diagnosis?
